<b>E-</b> 6	International Expeditions, Partial Summary of Cruise Information	133	

This study was financed by a contract with the National Council on Marine Resources and Engineering Development, Executive Office of the President. However, the findings, recommendations, and opinion in the report are those of the contractor and not necessarily those of the Council, nor do they imply any future Council study, recommendations, or position. It is hoped that this study will contribute to the full discussion of problem areas and issues in marine science affairs.

#### APPENDIX A

### REVIEW AND COLLATION OF DATA MANAGEMENT PLANS OF SELECTED ORGANIZATIONS

A contract requirement of Phase I is the accumulation, review and collation of the data management plans of selected organizations involved in marine science programs. In accomplishing this goal, organizational plans were obtained through personal interviews, in telephone conversations, and from existing literature. In some cases, the plans were general agency plans, not specifically oriented toward data management, whereas, others emphasized future data management plans. Table 1 lists organizations from which plans were obtained and further defines the type of plan and its format (this appendix).

The detailed process utilized in reviewing and collating the key elements of these plans is described in Section VIII. As stated there, the conclusions, recommendations and actions set forth in the plans were partitioned into 23 major subject areas as follows:

Α.	PHYSICAL	<b>OCEANOGRAPHY</b>
----	----------	---------------------

- B. BIOLOGICAL OCEANOGRAPHY
- C. CHEMICAL OCEANOGRAPHY
- D. METEOROLOGY
- E. GEOLOGY
- F. GEOPHYSICS
- G. SURVEYS
- H. FOOD AND FISHERIES
- I. MINERALS AND DRUGS
- J. WATER RESOURCES
- K. RECREATION
- L. POLLUTION

- M. RADIOACTIVITY
- N. ENGINEERING
- O. DATA MANAGEMENT
- P. PLATFORMS
- Q. SENSORS, INSTRUMENT SYSTEMS
- R. FACILITIES
- S. LEGAL, MANAGEMENT
- T. ORGANIZATION
- U. EDUCATION, TRAINING
- V. INTERNATIONAL PROGRAMS
- W. MISCELLANEOUS

The results are presented in the following pages of Table 2, this appendix. In general, each page in the table covers a separate subject, although several subjects are combined on some of the later pages for brevity. The overall generalized conclusions are synthesized and drawn together in Section VIII. All of the first level of aggregation of the plan elements, however, is included in the following pages for a more detailed study.

A few more comments are the coder regarding this collation process. Table 2 of this appendix, contains a complete listing of each of these topics and the categories in which they have been placed. The number of organization plans listed in Table 2 is less than that shown in Table 1, however. The Department of the Interior, for instance, has one column heading in Table 2, but has six in Table 1, since all of the marine programs for this department have been combined into one document. Industry plans were generally not discussed in sufficient detail to justify this inclusion in the chart. This was also true for other organizations so that the 20 organization plans listed in Table 2 were those finally selected for collation. The accession number refers to the SDC marine literature library number and the bibliography included in Volume I of this report.

The three columns on the right-hand side of each page of Table 2, this appendix, under the heading "Impact on Data," list relative effects on data collection, data processing or data use of each topic. This relative effect is a subjective attempt to determine whether or not a planned item will affect future data management requirements and to what extent. The assessment was made by contractor personnel. As an example of the procedure followed in making the assessment of effects, take topic 1, page 2, Table A-2. "Survey current delineation" which is planned by the USCG, the Navy and ESSA, according to entries in the chart. It is believed that large amounts of data are being and will have to be collected in order to delineate all currents in the world occans. Therefore, a "2", indicating a major impact, has been placed in the column entitled "collection."

Because of the subjective nature of this analysis, it is doubtful that complete agreement between reviewers could be obtained. The process did, however, serve the useful purpose of filtering the nearly 300 topics in Table 2, this appendix, and reducing the number to be considered to a somewhat smaller group as is described in Section VIII of Volume I of the report.

The collation and analysis carried out to date suggests that a further analysis be developed utilizing a matrix relating the plans of various organizations to the focus of recommendations found in the literature or resulting from interviews with users of oceanographic data. This suggests another tool which should become an ongoing function because of the dynamic nature of the marine science field.

R.S.	Accession No.	56	374	90	510	باجاز	27	226
1.	Obtain Arctic weather data							
2.	Determine symoptic Porecast requirements		3					x
3.	Study acesoons	13						
١.	Prepare cloud cover - symoptic maps	20				ļ		
9.	Improve and expand marine weather support to high seas shipping		5					
6.	Establish a standard for weather support to all U.S. marine activities		5			Ī		
7.	Improve weather support to marine activities in coastal waters, herbors		<u> </u>					
8.	Emmand and accelerate the dissemination of observations, forecasts for small craft		30	[		<u>!</u>	• !	
9.	Expand and accelerate collection and acquisition of marine observations		30,45		1		•	
10.	Develop service products to more clearly convey weather information		30,67				•	\ !
и.	laprove storm and hurricans varning systems	2c	1 5,68			†   	*	1
12.	Develop forecast capability at air-ass interface		,0					
13.	Suprove dissentantion of weather data		,					
14.	Obtain committed broadcast time for prompt dissemination of information		છા		1	Î i		
15.	Befine techniques for observing and forecasting visibility	1	£#8				<b>†</b>

COLLATION OF PLANS FOR THE NATIONAL MARINE DATA PROGRAM

E. GHOLOTT

Accessions No. 310 56 221 221. RECORDENDATION ON CONCLUSION 57 1. Study subbottom structure M-6 2. Determine sediment thickness 3. Collect bottom sample and nores 51 4. Investigate sediment transport 5. Determine sediment age 6. Burvey submarine campone, trenches 13,27 7. Determine continental shelf - history and origin 23 8. Develop prediction of tottom conditions in unsurveyed areas capability 9. Determine shape of continental shelf more adequately 10. Determine submerine mountain topography more edequately Conduct geophysical measurements to determine typical characteristics of mantle, crust 12. Study sedimentary rock formation affected by chemical processes 15 1]. Study sedimentary rock formation effected by biological processes 28 14. Beed boston topograph; charts 13 15. Study corel stells 51 16. Study turbidity current 17. Inventigate littoral drift and determine source of littoral materials 59 31

#### COLLATION OF PLANS FOR THE NATIONAL MARINE DATA PROGRAM

Trate of a large training to the training training to the training training to the training training to the training training training to the training traini 310 34b REPUTE PROPERTY OF THE PROPERT F. GEOPHYSICS Accession\* No. 56 RECOMMENDATION OR CONCLUSION 1. Investigate reversed magnetic polarization 2. Conduct seismic refraction surveys 3. Conduct gravity surveys 4. Need more accurate gravity measurements 5. Conduct magnetic surveys 35 6. Determine heat flow at benthic boundary 33 7. Investigate acoustic energy scattering 8. Investigate acoustic energy transmission paths in water 9. Investigate acoustic energy reflection 10. Prepare acoustic data bank 11. Study seismic reflection 12. Study natural ocean sounds (waves, wind, rain, earthquakes, marine animals) 13. Study industrial sounds (ships, submarines) 14. Determine energy transfer processes near large acoustic transmitters and receivers 15. Study and locate seismically active areas 20

RECONGRADATION OR CONCLUSION

2. Research dynamics of fish population

3. Research transfer of food through food web

4. Develop processes for making fish protein

8. Study geologic aspects of fish habitats

13. Implement production of anadromous fish

10. Develop processing fish for market

12. Conduct fish market research

11. Develop fish markets

14. Develop fishing gear

DOCUMENT TITLE

TABLE A-2 cont'd

#### COLLATION OF PLANS FOR THE NATIONAL MARINE DATA PROGRAM

H. FOOD AND FISHERIES

1. Isprove procedures to estimate size, distribution, behavior of fish

5. Investigate breeding organisms in captivity in the laboratory

5. Conduct systematic biological surveys and mapping of the world ocean

7. Increase production of phytoplankton by artificial fertilization

9. Study effects of geology on ecology of bottom fisheries

# COLLATION OF PLANS FOR THE NATIONAL MARINE DATA PROGRAM

Q. SENSORS, INSTRUMENT SYSTEMS (cont'd)

R. FACILITIES

Accession# No. 226 56 RECOMMENDATION OR CONCLUSION SENSORS, INSTRUMENT SYSTEMS (cont'd) 21. Standardize instruments 12 22. Develop inexpensive, simple data collection systems for small craft 21 23. Develop organic corbon measurement system (rapid, accurate) 61 24. Develop unmanned weather stations 68 68 25. Improve wave sensor, shipboard 68 26. Improve wind sensor, shipboard 68 27. Develop surf and breaker measurement device 28. Improve sensors for sea surface temperature, snipboard 68 k. FACILITIES 1. Establish marine wilderness preserves R-2 2. Construct submersible laboratories 8-M 3. Develop a nuclear power source 4. Organize Maury center for ocean science of the Navy 5. Install deep sea geophysical observatories (3) 5. Install magnetic observatories over East Pacific Rise (8) 7. Require computer for Coast Guard Oceanographic Unit 8. Organize an environmental computer facility, jointly operated NODC) 9. Establish marine forecast centers (6) (ESSA) 3

### APPENDIX B

## REVIEW AND COLLATION OF PERTIDENT PRIOR STUDIES AND LITERATURE

The literature and other studies review was conducted in the same way as the prior plans review, Appendix A. As documents were reviewed by various members of the project team, important information was underlined. The underlined information was then reviewed to provide the topic headings listed under 23 subject headings in Table 1, this appendix. The same subject headings were used for this appendix as for Table 2, Appendix A. The numbers in the cells of the matrix are the page numbers in the documents where the topic is discussed.

The same subjective method of assessing the impact of each topic listed on collection, processing and use of marine data was used in assessing the literature and studies as for prior studies, Appendix A. As was done in that case, the general conclusions drawn from these studies and literature reviews are drawn together and discussed in Section VIII.

Of the many documents reviewed, 27 are included in Table 1, Appendix B. The inclusion of additional documents would make the table extremely large and, in general, it is believed that a large percentage of the recommendations and conclusions occurring in the literature which may affect a marine data management system are included. Since studies are continually being made, however, review and additions to the table should be made during Phase II and this approach should be established as an ongoing project by the organization responsible for a national marine data management program.

#### APPENDIX C

#### PRIOR STUDY, PLANS AND LITERATURE ANALYSIS FORM

An analysis form was prepared at the beginning of the Phase I study for use in abstracting and compiling the information collected during the study, plans and literature review. A sample form is included as Table 1 in this appendix, which is filled in with the actual results of the review of one of the documents analyzed. The procedure followed was to underline pertinent information in the document as it was reviewed and then to copy the underlined information on to the abstract pages of the analysis (see pages 86 and 87) form. Each such entry is keyed to the document in two ways. First, the page in the document on which the information was found is listed on the right side of the left-hand column, as shown. Second, a four-digit code number is listed on the left side of the same column. The code is taken by the reviewer from the matrix on page 83. The matrix in turn codes two basic profiles of the abstracted item in terms which are pertinent to data management. For example, the reviewer issued four codes (2129, 2135, 2137 and 2143) to the abstract from page 106 listed in the next to the last paragraph on page 87. Since the discussion describes some of the functions of World Data Center A, the code 21 is used for all four entries. The variation in the last two digits of the four codes represents the functions performed, accuisition, storage, dissemination, and organization respectively.

The matrix is also employed to categorize broadly the nature of the content of the entire document being abstracted. This system was set up to provide rapid access to the source of the document data base using a computer and a general purpose retrieval program. In this way it becomes simple to search and locate the document and page number of all documents containing information pertinent to the 126 combinations of information defined by the matrix. The general purpose load and retrieval programs and computer time are currently available at SDC and they were applied during Phase I to an oceanographic data base, as described in Appendix D. Utilization of this capability should be considered during Phase II for implementation of a bibliographic retrieval capability for Marine Council use, employing a remote terminal if desired.

Table 1, described above, is a shortened and simplified version of the prior study, plans and literature analysis form included to illustrate the processes involved. Table 2 of this appendix illustrates a normal analysis for filled out in the detail which is more characteristic of the remainder of the documents reviewed.

# MARINE ENVIRONMENT PRIOR STUDY, PLANS AND LITERATURE ANALYSIS FORM

1.	Reviewer A. M. Rugg
	Does document describe:
	2. Prior Study 3. Organization Plans 4. Other Literature X
	For use in the Marine Environment Data Study, is the document
	5. Usable X 6. Not Usable
7.	Accession Number 57 8. Document Location (Lib. Shelf - Gaylord File - etc.)
9.	Author Richmond, Benjamin S.
10.	Title "Report of Oceanographic Data Exchange for the Year 1966"
11.	Source (Includes Coganization, Report Number, Journal, Vol., No., Date) World Data Center A, March 1967
L2.	Index Terms (Key Words) Standards, Data, World Data Center, Functions
L3.	Mission or Goals of Organizations as Applicable
L4.	Contract Title
15.	Contract No. 16. Date 17. Length of Contract
ιö.	Contracting Agency
	Contractor
	Cost of Contract

In the table on this page, an attempt to format the reviewed literature or plans for machine retrieval has been made. If an article describes Research and Development for Data Acquisition, an X would be placed in the box opposite data acquisition and under RAD. The definitions of column and row headings are attached. It is planned to retrieve information by any of the headings listed. The table does not eliminate the need for an abstract, which should be attached, to describe the various parameters marked in the table. It is expected that the table would be filled in after the abstract has been written. Entries in the abstract should be preceded by a four-digit number made up of the two, two-digit numbers for the cell in the table with which they are associated, the column first and row second. For instance, if an X is entered for Data Archival Requirements, the number 2235 in the abstract should precede information relating to it.

To reduce review time, it is recommended that the reviewer underline words, phrases or paragraphs which should be lifted from the text for entry into the abstract and place the same four-digit number described in the previous paragraph in the text. The typist can then go through the document and enter this information in the abstract with the corresponding number.

Mark each box of the matrix which indicates the content of the publication. Additional descriptions should be included in the abstract to indicate why the appropriate boxes were marked.

## TABLE C-1 cont'd

#### DEFINITIONS OF TERMS USED FOR THE LITERATURE SEARCH QUESTIONNAIRE

#### Column Heading Definitions

- 21. Function Any function performed by the items identified in the row headings should be included such as the function of constraints or an agency function.
- 22. Requirements Any needs for items identified in row headings such as sensor requirements or data archival requirements should be identified.
- 2]. Plans & Design This covers any plans or design relating to any item in the row heading such as the design of a platform or the plans for data use.
- 24. R & D If the article refers to research and development for an item in the row heading, this should be identified such as development of a data transmission system.
- 25. Operation If the operation of a data center is described, there would probably be discussions of data archival operations, data retrieval operations, etc. In the case of an agency, its overall operation may be described.
- 26. Cost If cost information concerning individual or groups of items listed in the row headings is described in the article, this should be identified in the appropriate column.
- 27. General Any areas not covered by other column headings should be included in this column and should be discussed in the abstract.

#### Row Heading Definitions

- 8. Data Type Description of parameter(s) recorded.
- 29. Data Adquisition\* Description of method of data capture by sensor, indicate collection agency.
- 30. Data Recording Description of mathod of recording data after oughture by sensor, such as surip chart recording or analog recording on magnetic tape.
- il. Data Processing Description of manual and computer processing for format conversions or mathematical and statistical computation. Tablecate processing agency.

<sup>\* 7</sup> and 30 c mbined constitute data collection

- 32. Data Use Description of uses of collected data.
- 33. Data Aetrieval Description of methods used to retrieve data from a data base, whether manual or automated.
- 34. Data Base Maintenance Description of method used to maintain manual or automated filing system.
- 35. Data Archival Description of methods used to maintain historical data.
- 36. Data Transmission Description of data transmission paths used to transmit data along any of the routes from data acquisition to the ultimate user. This is a description of routes of data transmission not hardware for accomplishing transmission.
- 37. Data Dissemination Description of methods used to disseminate data to ultimate users.
- 38. Data Quality Description of quality, accuracy, precision and range requirements and limitations.
- 39. Sensors Description of sensors, planned or existing.
- 40. Platforms Description of platforms used to collect data.
- 41. Communications Description of systems used to transmit data along any of the routes from data acquisition to the ultimate user.
- 4.1. Constraints Description of effect of the following constraints on data program:
  - a. Political
  - b. Legal
  - c. Economic
  - d. Technological
  - e. Physical
- 43. Organization Description of organizational activities related to data management.
- 44. Personnel Description of personnel involved in data management programs.
- 45. Other Any items not included in 28 through 44.

# TABLE C-1 cont'd

#### ABSTRACT

Identification Number	Abstracted Information
2745 .p.1	This report summarizes the oceanographic data exchange activities of World Data Center A, Oceanography, for the year 1966.
2729, 2737 p.2	The volume of data received during 1966 increased by 93% over that received in 1965. The volume of data supplied by this Center to other activities increased by 28% over that supplied in 1965.
2745 p.2	The total number of oceanographic stations held by the Center on 31 December 1966 was 99,535, compared with 74,264 for the same data in 1965. A tabulation of these data by years and countries is given in Table 2, which lists data received, the number of oceanographic stations by the years during which the data were gathered, and the countries under which these data are catalogued.
p.3	A summary of the number of oceanographic stations received during the period 1957 through 1963, and during the individual years 1964, 1965, and 1966 are given in Table 3 on page 10.
p.13	Catalogue numbers for data received through 31 December 1966 have been added to the list of the national oceanographic programs, given in the previous report (reference 6), and listed in the various issues of INTERNATIONAL MARINE SCIENCE (IMS). The list is arranged by countries in the same numerical sequence used in the CATALOGUE OF DATA. Under each country the cruises are given in the sequence of the issues of IMS. We have continued to attempt to match data received with the cruises listed in IMS on the basis of the most reasonable agreement of:
	<ul><li>(1) Country and ship's name;</li><li>(2) Beginning and ending dates of the cruise;</li><li>(3) The region(s) where the data were taken.</li></ul>
2243 p.102	The main principles governing the responsibilities of the WDCs and the nature of data interchange are founded on the IGY "Guide" and the experience gained during the IGY.
2745 p.104	(a) World Data Centers for collection and distribution of data. For each discipline, there are two or three such centers which operate according to the principles set forth in the Guide to WDCs.

## TABLE C-1 cont'd

ABSTRA	-	
Identification Number		Abstracted Information
2745 (Contin	p. 104 nued)	(i) World Data Center A, which consists of eleven subject-matter divisions and includes all disciplines.
		(ii) World Data Center B, which conists of two subject-matte: davisions and includes all disciplines.
		(111) World Data Center C, which consists of several discipline centers in several nations.
		(b) Centers for certain kinds of analysis and synthesis resulting in issuance of indices, certain tulletins of summary information, etc. There are two groups of such centers and provision is made for others as needed.
2745	p. 104	(1) Permanent Services.
2745	p. 105	(i') Special World Geophysical Centers
2243	p. 106	The objects of establishing several IGY World Data Centers for collecting IGY observational data were: (1) to insure against catastrophic destruction of a single center, (2) to meet the geographical convenience of, and provide easy communication for, workers in different parts of the world.

In the table on this page, an attempt to format the reviewed literature or plans for machine retrieval has been made. If an article describes Rusearch and Development for Data Acquisition, an X would be placed in the box opposite data acquisition and under RED. The definitions of column and row headings are attached. It is planned to retrieve information by any of the headings listed. The table does not eliminate the need for an abstract, which should be attached, to describe the various paremeters marked in the table. It is expected that the table would be filled in after the abstract has been written. Entries in the abstract should be preceded by a four-digit number made up of the two, two-digit numbers for the cell in the table with which they are associated, the column first and row second. For instance, if an X is entered for Data Archival Requirements, the number 2235 in the abstract should precede information relating to it.

To reduce review time, it is recommended that the reviewer underline words, phrases or paragraph: which should be lifted from the text for entry into the abstract and place the same four-digit number described in the previous paragraph in the text. The typist can then go through the document and enter this information in the abstract with the corresponding number.

Mark each box of the matrix which indicates the content of the publication. Additional descriptions should be included in the abstract to indicate why the appropriate boxes were marked.

## TARLE C-2

ABSTRACT "A study of the U. S. Coast and Geodetic Survey's Products and services as related to economic activity in the U. S. Continental-shelf Regions"

Identification Humber Abstracted Informatic: The report contains numerous tables on industrial activity related to offshore marine areas. The survey covered for more than C and OB products for instance the report discusses many fishing requirements unrelated to C and OB activities. ... A li-week study was made of the gross economic activity in the 2529 p.i U. S. continental-shelf regions, the dependency of that activity upon U. S. Coast and Geodetic Survey (CAGE) products and services. and the uses of and present needs of additional OSGS products and services relating to the U.S. continental-shelf regions. Posults are based on a digest of information obtained from: (1) interviews of about 70 private firms, 40 state and local organizations, 25 Federal organizations, and 9 universities; and (2) financial reports and other literature. 2228 P.1 Priority information needs ... In no particular order these are: (1) maps of bottom topography, (2) minoral composition and properties of bottom sediments and cores, (3) simultaneous measurements of current profiles over wide regions of near-shore and estuarine waters, and (4) ability to determine and /or reoccupy more precisely the geographical coordinates of points at sea or with respect to the sea bottom. F.III-20 Description of ther Problems and Meds. .. Offshore oil sal mas industry. (1) ... Briensico... Triangulation of certain fixed platforms. p.III-21 (2) ... Charts more up to inte. (3) ... Permanent marine positioning-control points. (b) ... Burth-estellite systems for positioning. (5) ... Advanced electronic systems for positioning. (6) ... Flace electronic positioning grids on its charts. (1) ... Charts...for locations not now normally frequented. (2) ... More detail on charte.

TABLE C-2 cont'd

Identification Number	Abstracted Information
2228	(5) Locations of submerged pipelines.
(Con't) p.III-21	(6) Charts or maps of the entire Gulf of Mexico should extend farther to the east and to the west.
	(7) Ocean-current data on navigational charts should be more complete.
	(1) Historical records of weather are needed.
p.III.=22	(2) Studies of waves and wave action are needed.
	(3) Historical data on waves
	(4) Formation, flow, and shear pressures of ice floes.
	(1) Data on the first few feet of bottom material are inadequate for.
	(2) Data on properties of bottom material down to 100 feet below the seafloor is needed.
	(3) Bottom and shoreline changes resulting from major hurricanes and storms should be put on charts as quickly as possible.
	(4) Interactions of bottom currents and sediments.
!	Widely spaced refraction (seismic) studies are needed.
	CAGS should make geophysical survey data accessible before the data are entirely complete.
p.III-24	Metals and Minerals
p,"II+36	Some of the needs expressed are as follows:
	(1) Three-dimensional mapping
	(2) More research and development in photogrammetry
	(3) Wide-range somer readings (4) Offshore-positioning devices
	(4) Offshore-positioning devices
İ	

## TABLE U-2 cont'd

Identification Number	Abstracted Information
2228 (Con't)	(5) Data for regions farther out from shore
p.III-36	(6) Data-transmission centers
	(7) Coring
	(8) More publications of data
	(9) Bottom-soil mechanics
	(10) Systematic mapping and sampling
	(11) Survey areas of interest.
p.III-39	Tsunami and Hurricane Protection
p.III-41	Major user problem is a lack of design criteria for protective construction.
	The ultimate objectives are the accumulate design criteria relative to:
	(1) Wave action in coastal waters
	(2) Shore processes
	(3) Tide and surge dynamics
	(4) Inlet and estuary dynamics
	(5) Sources and transport of littoral materials.
p.III-42	Waterways, and Beaches
p.III-44	Deficiencies in design criteriafor sediment mechanics, estuarine and inlet dynamics, and inshore ocean processes
	Effects of dredging on fishing grounds, cyster and clambeds, and wild life.
	Locating offshore deposits of sand.

# TABLE C-2 cont'd

	Shipbuilding
Con't) p.III-47	Criteria to design ships that will adsugately cope with the ocean-atmosphere-land mass processes.
p.III-48	Ship Salvage
	Quicker response for surveying navigable waterways.
p.III-80	Waste Disposal
p.III-81	Data on currents provided by C&GS are not detailed enough
p.III-88	Tsunami problems can be grouped under five topics: (1) improved prediction for both the occurrence of a tsunami and of the maximum amplitude of the waves; (2) prevention of tsunami damage; (3) public education; (4) near-coast characteristics and effects of coastal figuration, and (5) historical data on tsunamis.
p.III-101	Transportation
	Minimum-time path routing through forecasting of waves, winds, and currents.
	Bottom data for better port approaches, and new current- measurement points.
.	Aerial photography of shorelines for property boundary determination.
p.III-110	List of Needs of Fishing Industry Noted by Industry Representatives
	Estuarine circulation
	Interaction of air-sea surfaces
	Temperature and salinity measurements

## TARES C-2

Identification Number	Abstracted Information
2228 p-III-	Bathymetric surveys in more detail
(Com't) 110	Better markers and leveling data (particularly West Coast)
	More recent and accurate charts
	Locations of bottom hazards
	Loran lines on charts
	Determine economic value and locations of various seaweeds
	Development of more efficient gear and vessels
	Increase markets for fishery products
	Research on utilization of senfoods and by-products
	Enforcement of fishing area restrictions and sea laws
	Contour mapping of ocean floor (to replace soundings on charts)
	Survey of seaweed resources along all coasts
·	Locations of upwellings and reasons for same
	Tolerance levels of various marine species
	Current directions and rates of movement
	Tide movement and times in usable forms
	Environmental preferences of various species
	Evaluation of validity of soundings on present charts
	Large-scale chartize of critical areas
	Show land geography on appropriate portions of coast charts
	Detailed information on physical characteristics of the ocean in the Oulf of Maxico (particularly on continental shelf)

Identification Number	Abstracted Information
2228 p.III- (Con't) 110	Rechart sea bottom of the Gulf continental shelf
(Con't) 110	Add Loren stations (and lines on charts) in Gulf area
	Unmanned buoys to report sea conditions on the entire ocean
	Chemical and nutrient content of waters off coasts
	Wind and see state (on current basis) by seasons
	Improved tide and current information on West Coast
	Better geographic description of leases
	Make aerial photographs available to the public
	Measure of reliability assigned to chart information
	Charts based on standard grid and sultiples of the same
	Protection of bays from pollution and predators
	Surveillance of illegal shellfishing areas
	Make information available that appears now only on Army or Mavy charts Atlas of ocean environment presenting basic data and supplements or special charts of more recent information
p.III-117	Defense and Space
	(1) Geodetic positioning
	(2) Environmental marine data, including up-to-date charts.
p.III-126	Industrial Research and Development
	composition of sediments mechanics of sembottom materials

Identification Number	Abstracted Information
2228 p.III- (Con't) 127	More precise navigation and bathemetry charts are needed.
(302 6) 12/	Subbottom structures, location of shipwrecks, earthquake areas, and bottom current general ocean-shelf information maintained in an information center as most useful
p.III-129	Multiple uses for the continental shelf come into conflict
p.III-130	Problems and Needs Cited by Research and Development Investigators on the Continental-Shelf Regions
	CAGE must concentrate on areas where they are the strongest geodetic control, sounding, etc.
	Positioning is a big problem and is of great importanceneed a permanent grid or triangulation system in offshore similar to that on land
	Accurate bottum-reference system using beacons, trans- ponders, buoys, etc.
	Establishment of a geodetic datum for continental shelf.
	More accurate navigation system and reference extension of loran coverage. Place loran lines on CaOi charts.
	Hadar navigation system in harbors.
	Improve navigation aid.
	Underwater-sound mavigation.
	Systematic sapping of world oceans bronder CAGS mission in general geophysical surveys.
	Would like to see C&OB do in-house work on basic studies and theory, with a balance between two.
	Surveys for areas for waste disposal.
	Surveys to discover flat areas on the bottom which can be used for testing of somer, to calibrate equipment, etc.

Identification	
Number	Abstracted Information
2228 p.III- (Con't) 130	More accurate charts are needed than currently available
	Ch(B) charts are adequate for mavigation but perhaps not for special purposes and surveys. Shelf needs survass what is available from charts.
	Standardization of charts (C&CB, Mavy, Army Engineers)
	Conversion into the metric system
	More bathymetric maps.
	More detailed magnetic anomaly maps especially interesting areas. When such areas are discovered, C&B should then deviate from their schedule and survey it.
	Hore accurate sounding = 1 foot (for bucy design)
	Ice-cap soundings for future importance
	Extension of CAGS charts perhaps to Bermuda
	Charting of shipwrecks
	Update charts more frequently in areas of active changes
	Chart marthquake belts from underwater seismic date
	Provide special-purpose maps rather than crowding information
	Knowledge of shelf topographic, sediments, structure. This imoviedge could be used by others to make intelligent guesses at economic resources.
	Quick systems of collection and distribution of wants ographic records on abnormal tides.
	More information on stores occurrence, practical prediction system.
	Wave-prediction system.
•	More information on temperi.
	Better understanding of ocean environmental data.

# TABLE C-2 cont'd

Identification Number	Abstracted Information
2228 p.III- (Com't) 130	
	Surface-current studies in relation to bottom topography
	Chart currents with depth to bottom (vertical profiles)
	More tide gauges in remote areas (sway from population)
	More tidal and current prediction as functions of depth
	Hore correlation between tide prediction and precise leveling
	More systematic sampling of environmental programs
	Lock into reliability of old datum
	Examine leveling network on West Coast and tie them to one datum.
	Systematic studies of shelf with research institutes as part of it.
and the second s	Active participation and cooperation of research institutes with CACS survey programs CACS provide ship, they provide people
	Cooperation of CAGS with commercial fisheries to look for scattering layer.
	CAGS should be thinking of future problems 50 years from now.
	Pishing industries are suffering from lack of sufficient shelf information and from water pollution.
Parallel Commission of the Com	Cooperation of CAGS with Bureau of Mines to chart and locate mineral deposit.
	Detailed topographic maps using sparker and near-bottom varying dayth sounder.

Identification Number	Abstracted Information
2228 p.III - (Con't) 131	Study of substructure and mapping it.
(000 0) 131	More of bottom photography.
	Systematic bottom coring and sampling.
	More information on machanical property, physical properties distribution of bottom sediments for anchoring design, cables, acoustic, ASE, minerals and scientific purposes.
	Deep drilling and more of it systematically.
	Marine life on bottom.
	Marine biology and its effect on somer.
	Grid system for core sampling for systematic approach to mineral prospecting.
	Pottom surveys with small submersibles
	Use small submersible as a platform and tool to get to bottom information
	Progress on shelf has been held back because of inadequacy of shelf information.
	Government and C&GS should lead the way for emploitation of the shelf and not wait until industrial requirements are upon them.
	Present status in position control is inadequate; it should be provided by a Government agency.
	Government can take the risk of total shelf explorations.
	Original boat sheets should be furnished in full size (as they were in the past) to researchers who ask for them rether than reducing them photographically.
	Catalog or pamphlet of CMGS publications and how to obtain further information if needed.

Identification Number		Abstracted Information
2228 (Coast)	- 1	Three-dimensional visual aid maps on oceanography for management (unfamiliar with oceanography) to grasp easily.
		Continental-shelf data information center and CAGS as a part of it.
		Publication of CACB data soon after collection.
2745	p.i	Continuation of present CACS programs either scause of the level or the absence of CACS activity will not meet these needs on a timely basis.
	p.I-l	Project Objectives The grincipal objectives of this study were:
		(1) To identify present level of gross economic activities in the continental-shelf regions
		(2) To estimate the worth of CAGS products and services relating to the continental-shelf regions.
		(3) To identify the technical problems and data needs bearing on future developments in continental-shelf regions.
		(4) To consider the capability of CACE, in terms of present CACE programs, to meet the needs in Item (3) in the future.
		(5) To estimate future levels of economic activity in the continental-shelf regions.
		(6) To delimente present and future continental-shelf regions of commercial interest.
2732	¥-I-3	Users are represented by ten major groups:
		(1) Mining and Petroleum
		(2) Marine Engineering
		(2) Marine Engineering (3) Recreation

	-	Degree	Definition	
		Essential	User activity would be seriously reduced or discontinued in the absence of CLGS products and services	
		Fundamental	User activity is built on C&GS products and services. Lack of these, however, would not necessarily result in discontinuance of activity but would require major adjustments.	
		Adventageous	User activity could continue only with some difficulty or minor adjustments if CAGS products and services were not available.	
		Convenient	User activity makes use of C&OS products and services but would not be bampered by lack of same	
		Nonescential	User activity is not dependent on CAGS products and services.	

#### TABLE C-2 cont'd

### ADSTRACT #1

Identification Number	Abstracted Information
2745 p.I-6 (Cont.)	Separate subsections have been devoted to each of ten major groups. Within each subsection results are presented within four major topics:
	(1) Estimate of Present Sconomic Activity
	(2) Estimate of Worth of U. S. ChGS Products and Services
	(3) Description of ther Problems and Heeds
	(4) Estimate of Future Sconomic Activity.
2243 p.111	Cacs can improve its present service by:
	(1) Initiating a continuing customer analysis of CAGS products
	(2) Presentation of data in forms to better meet user requirements
	(3) Utilizing more effectively present CAGS field representatives to update information on user requirements.
p.II-10	CACE efforts are minimal in bottom topographic mapping and systematic sampling and asslymis of bottom materials. Symoptic current profile data over wide regions of near-shore and estuarize waters is apparently immeristant. CACE does not have a program marine geodesy
2143 p.II-1	CASE activities
	Eydrography Program
	Ocean Studies Program
	Fangurtien Frogram
	Sciencing Program
	Geodesy Program

## TABLE C-2 cont'd

#### APPENDIX D

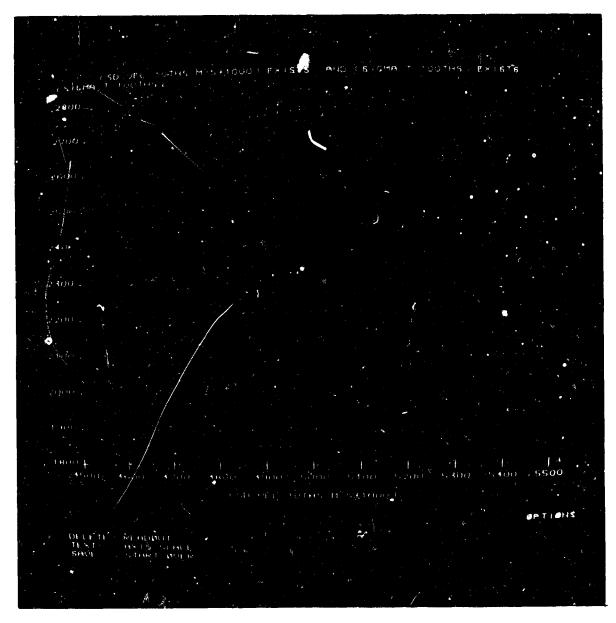

#### DATA MANAGEMENT TOOLS FOR MARINE RESEARCH

The growth of oceanographic data collection as a result of increased data capture activities and the merging of existing collections, offers to the researcher new opportunities for broad scope investigation, statistical analysis and hypothesis development. At the same time, and as a function of this growth, the problem of identifying and examining data subsets of potential use becomes substantial. The common problem facing the analyst at the outset of an oceanographic study is the problem of learning what data are available, how in gross terms the data are configured, and whether there are sufficient data of the proper sort to support the desired further detailed investigation. The search for appropriate material and pre-examination of its usefulness is often a frustrating and time-consuming process. It is fortunate in this situation that these problems, in the field of oceanography, are logically similar to the data retrieval problems encountered in other fields for which there have recently been developed some powerful general purpose data management tools. These tools are extremely useful for the handling of well-structured data collection such as, for instance, physical oceanographic data bases which consist of lists of phenomenological measurements, each list characterizing conditions at some point at some time.

It might be useful, for instance, for a researcher to be able to quickly check the vertical distribution of salinity or temperature at selected stations in order to decide if the data should be included in his sample. Through use of a device such as the general display system being developed at SDC, he would be able, after causing the data base of interest to be loaded into the system, to proceed by light-pen use to call for successive two-dimensional scatter plots of temperature versus depth and salinity versus depth. Visibly spurious data could be deleted. If he liked, he could (again by use of light-pen) call for an nth order curve to be fitted to the data.

To illustrate some of these capabilities a small oceanographic station data base was obtained from NODC covering one and one-half Marsden squares and containing about 800 oceanographic stations. The information was loaded into SDC's Q-32 time-sharing computer and a series of experiments were performed which are described briefly and illustrated on the following pages.

This illustration shows a scope plot, which in this case happens to be sigma-t\* versus sound velocity. Five light-pen actions were required--two each to specify the X and Y variables as selected from the displayed list of data base variables, and one to give the display command. The system has chosen the scaling on the basis of the range of retrieved data.

\*Sigma-t is a shorthend expression for the parameter of density ( $\rho$ ). It is described in the following manner: sigma t ( $\sigma$ ) = ( $\rho$ -1) 1000. For example, for a density of 1.02531,  $\sigma_{t}$  = 25.31

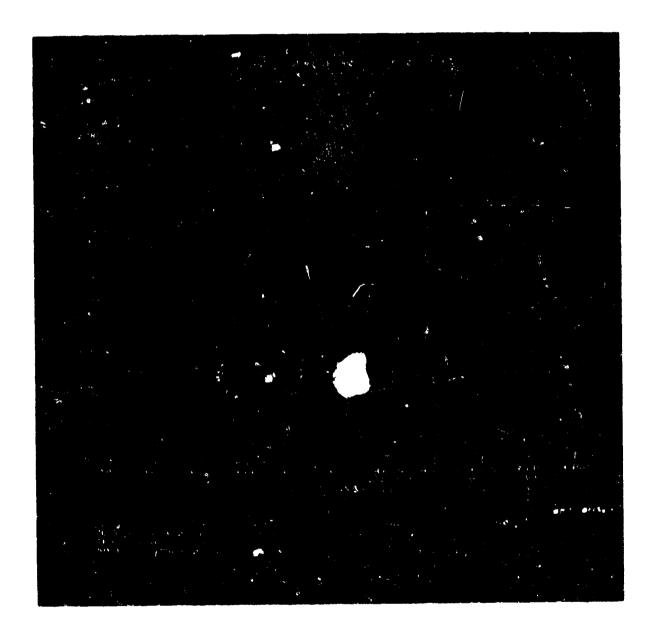

This illustration shows the curve centered and expanded on both axes as the result of light-pen adjustments to the X and Y scales. The title (at top) has been inserted via keyboard.

This illustration shows a readout of the X, Y values of a selected point (marked automatically after light-penning by a cross). The digital values are shown below the curve.

This illustration shows a blow-up of the knee of the curve achieved by again modifying the X and Y scales by light-pen.

Other options include the saving for later retrieval, and superimposition if desired, of any of the interim displays. It is possible at any time in the sequence to return to the initial display by activating "start over." The entire experimental process illustrated by the pictures consumed only about five minutes of the investigator's time.

The availability of such a device to a research would enable him to readily investigate the potential usefulness of available data, to get started earlier, and to avoid initiating studies that the availability and quality of data would not support.

The display system just demonstrated is the product of a current SDC developmental project that began with an existing data management system which employs a teletype for user interaction and added to it a display generation and interaction capability. The precursor system called LUCID provides all the tools necessary to perform the common file-processing functions of describing the entries in a data base, loading them into the machine, asking questions about them, performing calculations on them, having them presented for analysis, obtaining hard-copy reports, and maintaining the data base. The user may be asked by the system to supply parameters, control information, file names, operations to be performed, and format desired. He, in turn, may ask the system to define a term, to comment on a process he does not understand, to tell him what steps of a procedure are available, to explain error messages, or to give him other tutorial help. The system is worth examining at this point to indicate the sort of services obtainable from a general purpose interactive data management system employing a keyboard only. An oceanographic data base might have items such as the following:

NYNONYM	ELEMENT NAME DESCRIPTION
El	DECK POSITIVE INTEGER
<b>E</b> 2	(NODC REF) POSITIVE INTEGER
<b>E</b> 3	(CONSEC NO) POSITIVE INTEGER
E4	YEAR POSITIVE INTEGER
<b>E</b> 5	MO POSITIVE INTEGER
<b>E</b> 6	DAY POSITIVE INTEGER
E7	HOUR POSITIVE INTEGER
<b>E</b> 8	LAT POSITIVE INTEGER
<b>E</b> 9	HEM-NS CATEGORY
E10	LONG POSITIVE INTEGER
E11	HEM-EW CATEGORY

SYNCHYM	ELEMENT NAME DESCRIPTION
EIS	(Marsden SQ) Positive integer
E13	(DEC SQ) POSITIVE INTEGER
E14	(BOTTOM DEPTH M) POSITIVE INTEGER
E15	SHIP KAME
<b>E</b> 16	(DEPTH OBS M) POSITIVE INTEGER
<b>E17</b>	(SAL 100THS PPT) POSITIVE INTEGER

<b>E3</b> 5	(WAVE PER SEC) POSITIVE INTEGER
E36	(TYPE BOTTOM) NAME
<b>237</b>	TEMP POSITIVE
<b>8</b> 53	(SEA TYPE LOOTHS C) INTEGER
<b>E</b> 39	(SIGNA T 100TRS) INTEGER
E40	(ORGANISMS'CH ML) POSITIVE INTEGER
E41	(TOMP AIR 10THS C) INTEGER
Synoryms hay be used	Instead of Element Names

The data base listing, as above, is requestable after data base loading and is immediately printed in response to a DESCRIBE ELEMENTS command. Distinct values of any element are printed in response to a SHOW command.

# SHOW (TYPE BOTTOM) or SHOW E36 yields:

ΔJ	(GRY LOW CARBOMATE MUD)
<b>V</b> 2	(GLOBIGERINA COZE)
<b>v</b> 3	(ARGILLACEOUS GLOB COZZ)
174	(YELLOW-HLACK GLOB COZE)
<b>v</b> 5	(LOW CARBONATE LUTITE)
<b>v</b> 6	(MUDDY SAND)
<b>V</b> 7	(BILUE MUD)
<b>v</b> 8	(GRAY MUD)
<b>v</b> 9	(SAUDY MUD)
Vlo	(MUD)
Vll	(COURSE SAND)
<b>V</b> 13	(BLACK MUD)
V13	(DK GRAY SILTY CLAY)
V14	(GRAY STLITY CLAY)
V15	(SAND GREENISH MUD)

If the location of low carbonate lutite were desired, the statement could be entered PRINT LAT, LONG, WHERE (TYPE BOTTOM) 1Q (LOW CARBONATE LUTTIE) or shorter, PRINT E8, E10, WHERE E36 EQ V5. The result might be:

E8	400	Elo	1700
E8	600	Elo	1200
<b>E</b> 8	408	E10	1957
<b>E8</b>			

If a researcher were interested in isentropic analysis which involves investigation of the distribution of various properties on a constant density surface, he might wish to examine the salinity values lying between the signa-t surfaces of 22.70 and 23.00. In addition he would like to know the depth of occurrence of the sigma-t values. In order to do this he would order: PRINT (MARSDEN SQ), (SAL 100THS PPT), (DEPTH OBS M), (SIGMA T 100THS), WHERE (SIGMA T 100THS) GR\* 2269 and (SIGMA T 100THS) LS 2301.

Resulting in an output of:

E12	5	E17	3498	<b>E1</b> 6	10	<b>E39</b>	2270
E12	2	E17	3499	E16	20	<b>E</b> 39	2272
E12	2	E17	3505	<b>E16</b>	30	E39	2300

If the record were desired for permanent retention, use of the option BLOCK results in a labeled columnar cutput:

(MARSDEN SQ)	(SAL 100THS PPT)	(DEPTH ORS M)	(SIGMA T 100THS PPT)
2	3498	10	2270
2	3499	20	2272

This sort of system is extremely useful for obtaining quickly the answer to specific questions put to a data base. Because of the concordance-like structure employed in building the data bases and the use of direct access (disc) storage for the data base of reference all variables are equally accessible. Rapii searches of a full data base on any variable or logical combination of variables are possible. The retrieval language is simple and easily learned. The person needing the data can acquire it for himself without having to explain his requirements to an intermediary. This contributes to efficiency as well as savings in time. It is also important to note that the LUCID system contains a data base format definition and data base loading and updating mechanism that are readily controllable from the same teletype console used for retrieval interaction.

## APPENDIX E

# ESTIMATED VOLUME OF MARINE DATA COLLECTED BY SELECTED ORGANIZATIONS

As a result of interviews or literature review, the volume of some parameters of marine data collected by selected organizations was obtained and has been tabulated in Appendix E, Tables E-1 through E-6. Organizations for which this information is available include NAVOCEANO; University of Washington; Scripps Institution of Oceanography; Biological Laboratory, Honolulu, Bureau of Commercial Fisheries; California Cooperative Oceanic Fisheries Investigations; and International Expeditions. The source of the data for each cable is listed on the table. During Phase II, it will be important to determine the volume of marine data files for all organizations being contacted and whether or not they duplicate other files. For the data listed in this appendix, it is not known whether any duplication exists or not. Several of the illustrations in this report are based on the data tabulated in this appendix.

## APPENDIX ?

# LIST OF ORGANIZATIONS AND INDIVIDUALS CHETACTED NURING THE MARINE DATA MANAGEMENT STUDY - PRASE I

This appendix lists all organizations and individuals contacted during Phase I. They are grouped in categories of: Federal, Universities and Institutions, States and Industry. In some cases, several contacts were made with one individual or organization but they are only listed once in the table. A formal interview was held with some, including completion of the questionnaire. Interaction with others included exchanges of letters and telephone conversations. Virtually all of these organizations must be reviewed in greater depth during Phase II and others, not listed, must also be included.

## APPENDIX G

## QUESTIONNAIRE

A questionnaire was prepared at the beginning of Phase I for the purpose of gathering pertinent information concerning current and future data requirements and plans of marine organizations. Based on preliminary interview results it underwent three revisions during Phase I to improve the information collection processes. The final revision is included in this appendix.

The resulting questionnaire can be used by any organization, since it has been designed to determine data requirements, location, flow and volume, whether the organization is a data collector, processor, disseminator or user. The first section of the questionnaire is designed to obtain general information concerning the organization. The remaining sections deal specifically with the data collection, storage, processing and dissemination functions.

# MARINE DATA QUESTIONNAIRE

GEN	ERAL INFORMATION	Check if an Interview Interviewer
1.	Date   Year Month Day   Person Completing Form or Interviewee	Time End

Copy of Organization Chart

<sup>42.</sup> Names of Departments

<sup>43.</sup> Names of Department Heads

<sup>44.</sup> The relationship each department has in the organization's marine operations.

45. Additional description of organization

	Rank from 1 to 4 the relative importance of the following activities for the organization.
46.	Collector of marine data
47.	User of marine data
48.	Processor/disseminator of marine data (data center)
49.	Disseminator of marine data
	Are there limitations on the collection of data? If so, please rank the following parameters from 1 to 6 according to relative importance.
<b>5</b> 0.	Political
51.	iegal
<b>5</b> 2.	Economic
53.	Technological
54.	Physical
55.	Other (specify)
56	If the enguer is you to any of the shows nlesse evaluin

57.	Have prior studies concerning data management been made by your organization?  If so, are they published?  Are they available to SDC?
58.	What are the current plans of your organization concerning data

management? If available in printed form, is a copy available to

SDC? If not printed, please describe them.

59. Do you know of new sampling programs, instruments or systems now under development which will provide additional data in large volume in the future? If so, please describe and estimate the increased volume and the time when increased volume will occur.

60.	hre data exchanged with other	er countries? If so, please complete.
	Data Type (See Attachmert A)	Country with which data are exchanged

61. What is the time response requirement for data received from other sources?

62. Is there a system in your organization for document indexing, storage and retrieval in use now? If so, please describe. Is the indexing system documented? If so, are copies available to SEC for loan or retention?

# COST OF DATA HANDLING

63. ITM#	64. INITIAL (dollars)	65. ATRUAL MAINTENANCE (dollare)	66. ANNUAL OPERATION (dollars)	67.
			:	
• • • • • • • • • • • • • • • • • • •				
; ; ;				

<sup>\*</sup>Please list items used for data collection, storage, processing, etc., including type, manufacturer or description of instruments, equipment, platforms (ships, buoys), more ster hardware, computer software, remote terminals, etc.

## B. DATA COLLECTION

If your organization is involved in marine data collection please complete the attached Data Collection form. Attachments A and B have been included to serve as guidelines in filling out rows 13 and 18. If the list is inadequate for your purposes it would be appreciated if you would make additions as necessary.

In addition to completing the summary sheet it would be helpful if the answers to the following questions could be supplied.

What are the types, duration, and frequency of your surveys or cruises?

1. Type	2. Duration	3. Frequency
		an extensional methodological and the state of the state

<sup>4.</sup> Does your organization participate in cooperative cruises and surveys, either on a local, state, national or international basis?

If so, what type of surveys and cruises and how frequently?

	be helpful if you would include information regarding the data that is obtained in this manner on the attached Data Collection Summary form.  Additionally, if several sensors are used simultaneously, are:
5.	Sensor outputs combined into a single output?
6.	Sensor outputs recorded individually?
7.	Other combinations of recording or summation used (specify)?
8.	Please add any description of arrays which will add to an understanding of the data types and volumes involved.
	If you collect classified or proprietary data, please indicate by a check mark in the appropriate rows on the attached Data Collection table.
9.	Are examples of marine data types collected by your organization available?
10.	For permanent retention by SDC?
11.	Can they be borrowed?
12.	In the literature? If so. where

# DATA COLLECTION

13.	Data Type (See Attachment A)			
14.	Method of Collection (Sensor or System Name i.e., Nansen Cast, BT)			
15.	Manufacturer and Model Number			
16.	Platform Used for Data Collection (Ship, Buoy, etc.)			
17.	Frequency of Data Collection (i.e., 10 BT's/Day)			
18.	Data Collection Format (See Attachment B)			
19.	Data Transmission Mode (Mail, Teletype, etc.)			
	Current Volume/Year			
20.	1968			
21.	1969			
22.	1970			
23.	1975			
24.	1980			
25.	Are Data Proprocessed Prior to Recording and Storage? If so, how? (i.e., sensor instruments, preprocessing, computer, manual, etc.)			
26.	Use of Data (research, forecasting, planning, etc.)			
27.	Classified			
28.	Proprietary			

# C. DATA USE

If your organization utilizes marine data provided by other sources, please complete the attached Data Use form. Attachments A and B have been included to serve as guidelines in filling out rows 1 and 3. If the list is inadequate for your purposes it would be appreciated if you would make additions as necessary.

If you receive classified or proprietary data, please indicate by a check mark in the appropriate rows.

#### D. DATA PROCESSING AND STORAGE

If your organization is involved in the data processing and storage aspects of marine data management, please complete the attached summary sheet. Attachments A and B have been included as guidelines in filling out rows 6 and 8. If the list is inadequate for your purposes, it would be appreciated if you would make additions to it as necessary.

In addition to completing the summary sheet, it would be helpful if the answers to the following questions could be supplied.

Do your data files duplicate those maintained by other organizations? If so, please list the data files and the organization where duplicates are available.

1.	Data Type (From Attachment A)	2.	Data Volume	3.	Organization, Location
	****				

If any of your marine data files and outputs are classified or are of a proprietary nature, please indicate by a check mark in the appropriate rows on the attached summary sheet.

If there is a system for ultimate declassification, or release of classified data, please describe for each data type.

#### E. DATA DISSEMINATION

If your organization is involved in disseminating marine data, please complete the attached summary sheet. Attachments A and B have been included to serve as guidelines in filling out rows 6 and 7.

If the list proves to be inadequate for your purposes, it would be appreciated if you would make additions to it as necessary.

In addition to completing the summary sheet, it would be helpful if the answers to the following questions could be supplied:

1.	Is a special form used to request your data? If so, are copies available for retention by SDC?
	Are examples of your data outputs available?
2.	For permanent retention by SDC?
3.	Can they be borrowed?
4.	In the literature? If so, where?
	If you disserinate classified or proprietary data, please indicate by

a check mark in the appropriate row on the attached summary sheet.

#### G. DATA FLOW CHART

If your organization collects and transmits data to other user agencies, it would be appreciated if you would fill out the attached Data Flow Chart Summary as completely as possible. In addition, it would be helpful if you could provide SDC with a schematic drawing of the data flow from your organization to other organizations on the attached table.

An example of a completed Data Flow Chart Summary and Schematic Data Flow Diagram is shown below.

Please use a separate summary sheet to describe future data flow patterns which do not currently exist.

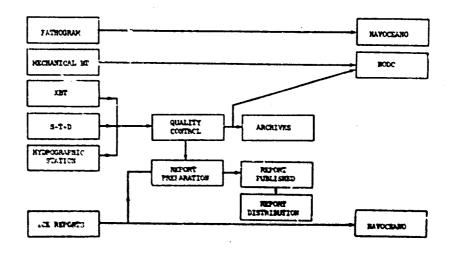

#### DATA FLOW CHART SUMMARY

rganization Producing Data U. S. Coast Guard Date 7/19/67  Person Interviewed Cmdr. R. Dingmore Reviewed with C.G. 10/06/67  Title Commanding Officer, Coast Guard Oceanographic Unit, Building 159-E

#### APPENDIX H

#### PRELIMINARY RECOGGRADATIONS FOR \_ JARRENTATION DEVELOPMENT AND USE

From a very cursory review of current marine data collection and handling practices a few recommendations for immediate consideration emerged from Phase I as follows:

1. In the area of sensing instruments:

Encourage a systems approach to sensing instrument development programs.

Today, most sensing instruments are developed to meet relatively narrowly defined objectives. Many do not produce electrical output signals. To make progress toward system goals each new sensing instrument development should incorporate the following thinking as applicable:

- a Encourage electrical output signals, preferably of standard amplitude ranges, as is done in most telemeter instrument developments.
- Encourage built-in calibrators, operable on remote command.
- Encourage the provision of standard signal conditioning packages including buffer amplifiers to raise low level analog signals to standardized recording levels.
- Encourage consideration of system cost/benefit effects of designing the instrument to provide direct digital output.
- 2. In the area of cruise ship instrumentation:
  - a. Encourage the further development of standard recording systems for all marine data in electrical signal form. Such systems should:
    - Contain a master date-time generator and displays for recording on all data recording mechanisms throughout the ship (central recorders, specialpurpose recorders like the fathometer, even on handlogged data forms). This generator should also put out cruise identification frequently.

- Provide multiple channel input capacity, selectable in modular sets to fit the cruise mission. Use one or more standard tape recorders as needed.
- e Incorporate time multiplexing to efficiently handle very low bandwidth and sampled signals.
- Incorporate provisions for recording ship track information, verbally or automatically.
- e Provide analog strip-chart play-outs of recorded variables to enable quality assurance, correlation of events and accentific calculations.
- Incorporate one or more voice channels for recording field operating conditions, key changes in techniques being tried, etc., in order to enable ease of playback intrepretation and editing and to assure against loss of this vital information.

Consider lending simplified versions of this equipment to investigators operating on even the smallest ships. The advantages of a truly simple-to-operate, field-worthy, modular unit to the investigator in most cases provide sufficient incentive for him to foster its use. The advantages to the National Marine Data Program are manifold, but hinge around increasing the accuracy and correlatability of marine observations and thus the building of knowledge of the marine environment for achievement of national goals.

b. Develop an inexpensive shipboard unit for semi-automatic navigation satellite tracking in order to provide accurate ship track information.

Consider landing these units to investigators using even the smallest ships. The advantage to the investigators of having accurate track information should in most cases provide sufficient incentive for them to take care of and operate the units. The advantage to the National Marine Data Program is of course, another increment in the upgrading of overall marine data accuracy and the correspondingly increased capability to correlate the cruise information with other data gathered from that region:

c. Develop seeled "Black Box" oceanographic recording units for emplacement on Ships of Opportunity. These units, recording such variables as sea surface temperature, should provide useful information, but they pose many problems as well. Among them are: time synchronization at beginning of cruise, loss of time clock

-173-(last page)

synchronization during and after ship's power outages; mishandling of probes unless they are beyond reach of the crew; difficulty of correlating recorded data with ship track information. But above all the problem is lack of direct benefit to the vessel operator. He therefore has no incentive to care for the device or submit the recordings promptly.

It is this fundamental benefit problem which will undoubtedly limit the utility of Ships of Opportunity as marine data observation platforms. One hope lies in the sealed black box approach similar to that used successfully by the Air Force in their crash recorder program and the newly adopted airline recorder designed to monitor flight variables. In both cases, the recorder operation is beyond the control of the pilot. It simply comes on when the master switch is thrown.

Outwardly, these precedents may sound similar to the ship problem and thereby give promise. In reality, however, a fundamental difference still exists. The operators of the aircraft, i.e., the Air Force and the airlines want the information provided by the black box. They therefore see that installation of sensors, cables, etc., is proper and that frequent inspections are performed. Only the pilots are inclined to drag their feet. In the case of ships, however, neither the ship operator nor the ship captain has such an incentive. Hence, the assurance of useable results is a far more difficult problem for Ships of Opportunity than for the case of aircraft recorders.

#### CONTINUATION OF ABSTRACT IND FORM 1473

- 2. Interviews were conducted with:
  - 75 persons in 28 Federal Agencies.
  - 20 persone in six Scientific Institutions.
  - 10 persons in seven Regional Authorities and in Industry.

These interviews included organizations whose activities spanned the entire spectrum of marine data functions; collection, processing, storage and retrieval, dissemination and use.

- 3. A detailed methodology was developed for structuring the Phase II design efforts. This methodology was applied during Phase I for the preliminary analysis of:
  - Bational Marine Science Program Objectives
  - Punctional Requirements
  - Data Program Requirements
  - Constraints
  - o Effectiveness Analysis of Data Programs
  - Cost/Benefit/Effectiveness Analysis of Data Programs
  - & Data System Requirements
